

Are you looking to reduce energy costs?

As energy costs increase and the government is providing incentives to reduce energy consumption, EnergyView™ could help you dynamically reduce your power usage, improving efficiency and cutting bills.

Taking signals directly from power monitoring devices, or directly from your existing energy management systems, EnergyView provides a full drill-down structure from total site down to individual machines.

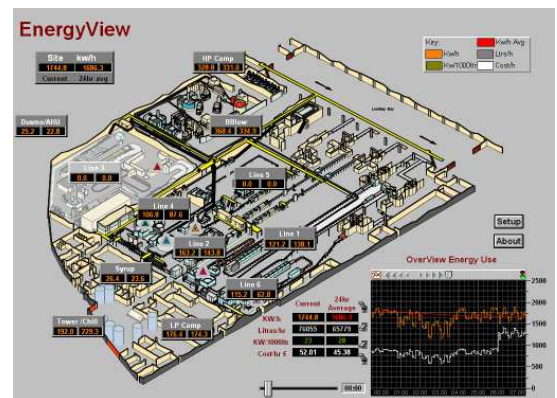

EnergyView will not only help you identify your top level savings through trending and site analysis, it will also provide live interactive machine-based reports for your teams on the factory floor.

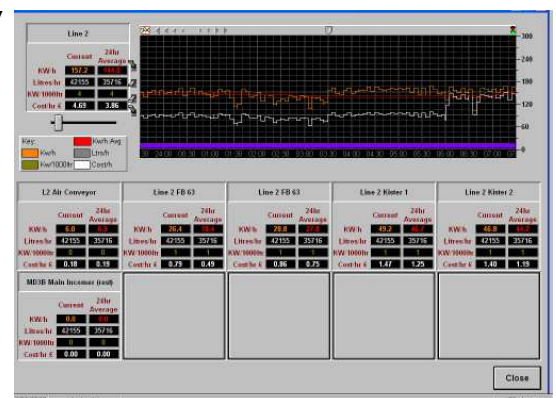

Key benefits

- Monitors real time power usage across the site enabling your teams to identify losses and take energy saving actions.
- Summarises power consumption across each of your lines and functional areas.
- Compares power consumption with production volume to provide a cost per hour of production or cost per area.
- Quickly identifies opportunities to save energy and cut costs.
- Possible to link energy consumption to visual or audible alarms to prompt actions on the line during machine downtime

Review site-level performance and analyse consumption over time

Review your line consumption in real time: make interventions and instantly see the effect to your energy consumption

With EnergyView you will be able to involve your line and management teams to realise dramatic reduction in your power consumption.
